REVISION HISTORY

Revision	Release Date	Summary
1.0	2007/01/15	First release for ALC662.
1.1	2008/03/15	Added ALC662-VC (ALC662 C version) data. Update passband ripple information in Table 82, page 64.
1.2	2008/12/02	Correct General Description and Software Features sections. The ALC662 supports Dolby Digital Live (Dolby Home Theater is not supported). ALC662-VC part number corrected to ALC662-VC0-GR.
1.3	2009/07/03	Added ALC662-VC1-GR part number information. Revised Table 85, page 66.

1. General Description

ALC662 products are 5.1 Channel High Definition Audio Codecs designed for Windows Vista premium desktop and mobile PCs. The ALC662, ALC662-VC0, and ALC662-VC1 (ALC662 version C series) meet audio performance and function requirements for the latest Microsoft WLP3.10 (Windows Logo Program).

The ALC662-VC series (ALC662-VC0 and ALC662-VC1) are upgraded versions of the ALC662 that pass stricter WLP performance requirements (See section 2.3 ALC662-VC Series Upgraded Features for Future WLP, page 4).

The ALC662 series feature three stereo DACs, two stereo ADCs, and legacy analog input to analog output mixing, to provide fully integrated audio solutions for multimedia PCs and ultra mobile devices.

All analog IO (except CD-IN and PCBEEP) are input and output capable, and three headphone amplifiers are also integrated to drive earphones on front (port-E and port-F) and rear panel (port-D).

The ALC662 series support 16/20/24-bit SPDIF output function and a sampling rate of up to 96kHz. They offer easy connection of PCs to high quality consumer electronic products such as digital decoders and speakers.

The ALC662 series support host audio from Intel chipsets, and also from any other HDA compatible audio controller. With EAX/Direct Sound 3D/I3DL2 compatibility, software utilities like Karaoke mode, environment emulation, multi-band software equalizer, 3D positional audio, and optional Dolby® Digital Live and DTS® CONNECT™ programs, the ALC662 series provide an excellent home entertainment package and game experience for PC users.

2. Features

2.1. *Hardware Features*

- Meets premium audio requirements for Microsoft WLP 3.10 (ALC662 and ALC662-VC series)
- Meets stricter performance requirements for future WLP (ALC662-VC series)
- Six-channel DAC supports 16/20/24-bit PCM format for 5.1 channel audio solution
- Two stereo ADCs support 16/20-bit PCM format
- All DACs support independent 44.1k/48k/96kHz sample rate
- All ADCs support independent 44.1k/48k/96kHz sample rate
- Supports 44.1k/48k/96kHz SPDIF output
- All analog jack ports are stereo input and output re-tasking
- Analog differential CD input
- Supports analog PCBEEP input
- Integrates digital BEEP generator
- Up to four channels of microphone array input are supported for AEC/BF application
- Supports legacy analog input to analog output mixer
- Three built-in headphone amplifiers for port-D (rear panel), port-E and port-F (front panel)
- Software selectable 2.5V and 3.2V reference output for microphone bias
- Software selectable boost gain (+10/+20/+30dB) for analog microphone input
- Two jack detection pins: each supports detection of up to 4 jacks
- Jack detection function is supported when device is in power down mode (D3)
- Supports two GPIO pins (General Purpose Input Output)
- Supports EAPD (External Amplifier Power Down) control for external amplifier
- Supports 1.5V~3.3V scalable I/O for HD Audio link
- Supports anti-pop mode when analog power AVDD is on and digital power is off
- 48-pin LQFP ‘Green’ package
- The ALC662-VC series is fully pin compatible with the ALC662, and both are pin-to-pin compatible with the ALC88x series and ALC262 series audio codecs

2.2. *Software Features*

- Meets Microsoft WLP 3.10 and future WLP audio requirements
- WaveRT based audio function driver and logo ready for Windows Vista
- EAX™ 1.0 & 2.0 compatible
- Direct Sound 3D™ compatible
- I3DL2 compatible (Windows XP only)
- 3D Positional Audio
- Emulation of 26 sound environments to enhance gaming experience
- Multi-band software equalizer and software tools are provided
- Voice Cancellation and Key Shifting effects
- Dynamic range control (expander, compressor, and limiter) with adjustable parameters
- Intuitive Configuration Panel (Realtek Audio Manager) for enhanced audio experience
- Provides 10-foot GUI for Windows Media Center
- Microphone Acoustic Echo Cancellation (AEC), Noise Suppression (NS), and Beam Forming (BF) technology for voice application
- Smart multiple streaming operation
- Dolby® Digital Live (optional software feature)
- DTS® CONNECT™ (optional software feature)
- SRS® TruSurround HD (optional software feature)

2.3. ALC662-VC Series Upgraded Features for Future WLP

- DAC and ADC keep good THD+N when tested with -1dB test signal (-3dB in WLP3.10)
- DAC and ADC have less than $\pm 0.02\text{dB}$ frequency response ripple ($< \pm 0.25\text{dB}$ in WLP3.10)
- Meets performance measurement when sweeping 44.1kHz sample rate content across 20Hz to 20KHz (20Hz to 17.6KHz in WLP3.10)
- The ALC662-VC1 improves anti-pop functions and reduces power consumption when the Audio system is not in use. This is especially useful when designing equipment to meet the Energy Using Products (EUP) directive for IT equipment

3. System Applications

- Desktop and mobile multimedia PCs
- Ultra mobile PCs

5. Pin Assignments

Figure 2. Pin Assignments

5.1. Package and Version Identification

Green package is indicated by a 'G' in the location marked 'T' in Figure 2. The version number is shown in the location marked 'VV'. For example, 'VV=C0' indicates silicon version 'C' and stepping version '0', which is the stepping of the ALC662-VC0.

7. High Definition Audio Link Protocol

7.1. Link Signals

The High Definition Audio (HDA) Link is the digital serial interface that connects the HDA codecs to the HDA Controller. The HDA link protocol is controller synchronous, based on a 24.0MHz BIT-CLK sent by the HDA controller. The input and output streams, including command and PCM data, are isochronous with a 48kHz frame rate. Figure 3 shows the basic concept of the HDA link protocol.

Figure 3. HDA Link Protocol

7.1.1. Signal Definitions

Table 6. Link RESET#

Item	Description
BCLK	24.0MHz bit clock sourced from the HDA controller and connecting to all codecs.
SYNC	A 48kHz signal used to synchronize input and output streams on the link. It is sourced from the HDA controller and connects to all codecs.
SDO	Serial Data Output signal driven by the HDA controller to all codecs. Commands and data streams are carried on SDO. The data rate is double-pumped; the controller drives data onto the SDO, the codec samples data present on SDO with respect to each edge of BCLK. The HDA controller must support at least one SDO. To extend outbound bandwidth, multiple SDOs may be supported.
SDI	Serial Data Input signal driven by the codec. This is point-to-point serial data from the codec to the HDA controller. The controller must support at least one SDI. Up to a maximum of 15 SDI's can be supported. SDI is driven by the codec at each rising edge of BCLK, and sampled by the controller at each rising edge of BCLK. SDI can be driven by the controller to initialize the codec's ID.
RESET#	Active low reset signal. Asserted to reset the codec to default power-on state. RESET# is sourced from the HDA controller and connects to all codecs.

Table 7. HDA Signal Definitions

Signal Name	Source	Type for Controller	Description
BCLK	Controller	Output	Global 24.0MHz Bit Clock.
SYNC	Controller	Output	Global 48kHz Frame Sync and Outbound Tag Signal.
SDO	Controller	Output	Serial Data Output from Controller.
SDI	Codec/Controller	Input/Output	Serial data input from codec. Weakly pulled down by the controller.
RESET#	Controller	Output	Global Active Low Reset Signal.

Figure 4. Bit Timing

7.1.2. Signaling Topology

The HDA controller supports two SDOs for the outbound stream, up to 15 SDIs for the inbound stream. RESET#, BCLK, SYNC, SDO0, and SDO1 are driven by the controller to codecs. Each codec drives its own point-to-point SDI signal(s) to the controller.

Figure 5 shows the possible connections between the HDA controller and codecs:

- Codec 0 is a basic connection. There is one single SDO and one single SDI for normal transmission
- Codec 1 has two SDOs for doubled outbound rate, and a single SDI for normal inbound rate
- Codec 3 supports a single SDO for normal outbound rate, and two SDIs for doubled inbound rate
- Codec N has two SDOs and multiple SDIs

The multiple SDOs and multiple SDIs are used to expand the transmission rate between the controller and codecs. Section 7.2 Frame Composition, page 12, describes the detailed outbound and inbound stream compositions for single and multiple SDOs/SDIs.

The connections shown in Figure 5 can be implemented concurrently in an HDA system. The ALC662 is designed to receive a single SDO stream.

Figure 5. Signaling Topology

7.2. Frame Composition

7.2.1. Outbound Frame – Single SDO

An outbound frame is composed of one 32-bit command stream and multiple data streams. There are one or multiple sample blocks in a data stream. Only one sample block exists in a stream if the HDA controller delivers a 48kHz rate of samples to the codec. Multiple sample blocks in a stream means the sample rate is a multiple of 48kHz. This means there should be 2 blocks in the same stream to carry 96kHz samples (Figure 6).

For outbound frames, the stream tag is not in SDO, but in the SYNC signal. A new data stream is started at the end of the stream tag. The stream tag includes a 4-bit preamble and 4-bit stream ID (Figure 7).

To keep the cadence of converters bound to the same stream, samples for these converters must be placed in the same block.

Figure 6. SDO Outbound Frame

Figure 7. SDO Stream Tag is Indicated in SYNC

7.2.2. Outbound Frame – Multiple SDOs

The HDA controller allows two SDO signals to be used to stripe outbound data, completing transmission in less time to get more bandwidth. If software determines that the target codec supports multiple SDO capability, it enables the ‘Stripe Control’ bit in the controller’s Output Stream Control Register to initiate a specific stream (Stream ‘A’ in Figure 8) to be transmitted on multiple SDOs. In this case, the MSB of stream data is always carried on SDO0, the second bit on SDO1 and so forth.

SDO1 is for transmitting a striped stream. The codec does not support multiple SDOs connected to SDO0.

To ensure that all codecs can determine their corresponding stream, the command stream is not striped. It is always transmitted on SDO0, and copied on SDO1.

Figure 8. Striped Stream on Multiple SDOs

7.2.3. Inbound Frame – Single SDI

An Inbound Frame – Single SDI is composed of one 36-bit response stream and multiple data streams. Except for the initialization sequence (turnaround and address frame), SDI is driven by the codec at each rising edge of BCLK. The controller also samples data at the rising edge of BCLK (Figure 9).

The SDI stream tag is not carried by SYNC, but included in the SDI. A complete SDI data stream includes one 4-bit stream tag, one 6-bit data length, and n-bit sample blocks. Zeros will be padded if the total length of the contiguous sample blocks within a given stream is not of integral byte length (Figure 10).

Figure 9. SDI Inbound Stream

Figure 10. SDI Stream Tag and Data

7.2.4. Inbound Frame – Multiple SDIs

A codec can deliver data to the controller on multiple SDIs to achieve higher bandwidth. If an inbound stream exceeds the data transfer limits of a single SDI, the codec can divide the data onto separate SDI signals, each of which operate independently, with different stream numbers at the same frame time. This is similar to having multiple codecs connected to the controller. The controller samples the divided stream into separate memory with multiple DMA descriptors, then software re-combines the divided data into a meaningful stream.

Figure 11. Codec Transmits Data Over Multiple SDIs

7.2.5. Variable Sample Rates

The HDA link is designed for sample rates of 48kHz. Variable sample rates are delivered in multiple or sub-multiple rates of 48kHz. Two sample blocks per frame result in a 96kHz delivery rate, one sample block over two frames results in a 24kHz delivery rate. The HDA specification states that the sample rate of the outbound stream be synchronized by the controller, not by the codec. Each stream has its own sample rate, independent of any other stream.

The HDA controller supports 48kHz and 44.1kHz base rates. Table 8, page 16, shows the recommended sample rates based on multiples or sub-multiples of one of the two base rates.

Rates in sub-multiples (1/n) of 48kHz are interleaving n frames containing no sample blocks. Rates in multiples (n) of 48kHz contain n sample blocks in a frame. Table 9, page 16, shows the delivery cadence of variable rates based on 48kHz.

The HDA link is defined to operate at a fixed 48kHz frame rate. To deliver samples in (sub) multiple rates of 44.1kHz, an appropriate ratio between 44.1kHz and 48kHz must be maintained to avoid frequency drift. The appropriate ratio between 44.1kHz and 48kHz is 147/160. Meaning 147 sample blocks are transmitted every 160 frames.

The cadence ‘12-11-11-12-11-11-12-11-11-12-11-11-11- (repeat)’ interleaves 13 frames containing no sample blocks in every 160 frames. It provides a low long-term frequency drift for 44.1kHz of delivery rate. Rates in sub-multiples (1/n) of 44.1kHz also follow this cadence *and* interleave n empty frames. Rates in multiples (n) of 44.1kHz applying this cadence contain n sample blocks in the non-empty frame AND interleave an empty frame between non-empty frames (see Table 10, page 17).

7.3. Reset and Initialization

There are two types of reset within an HDA link:

- **Link Reset.**
Generated by assertion of the RESET# signal. All codecs return to their power-on state
- **Codec Reset.**
Generated by software directing a command to reset a specific codec back to its default state

An initialization sequence is requested after any of the following three events:

- Link Reset
- Codec Reset
- Codec changes its power state, e.g., hot docking a codec to an HDA system

7.3.1. Link Reset

A link reset may be caused by any of the following three events:

1. The HDA controller asserts RESET# for any reason (power up, or PCI reset)
2. Software initiates a link reset via the 'CRST' bit in the Global Control Register (GCR) of the HDA controller
3. Software initiates power management sequences. Figure 12, page 19, shows the 'Link Reset' timing including the 'Enter' sequence (❶~❺) and 'Exit' sequence (❻~❾)

Enter 'Link Reset':

- ❶ Software writes a 0 to the 'CRST' bit in the Global Control Register of the HDA controller to initiate a link reset
- ❷ As the controller completes the current frame, it does not signal the normal 8-bit frame SYNC at the end of the frame
- ❸ The controller drives SYNC and all SDOs to low. Codecs also drive SDIs to low
- ❹ The controller asserts the RESET# signal to low, and enters the 'Link Reset' state
- ❺ All link signals driven by controller and codecs should be tri-state by internal pull-low resistors

Exit from ‘Link Reset’:

- ⑥ If BCLK is re-started for any reason (codec, wake-up event, power management, etc.)
- ⑦ Software is responsible for de-asserting RESET# after a minimum of 100µs BCLK running time (the 100µsec provides time for the codec PLL to stabilize)
- ⑧ Minimum of 4 BCLKs after RESET# is de-asserted, the controller starts to signal normal frame SYNC
- ⑨ The codec drives its SDI to request an initialization sequence (when the SDI is driven high at the last bit of frame SYNC)

Figure 12. Link Reset Timing

7.3.2. Codec Reset

A ‘Codec Reset’ is initiated via the Codec RESET command verb. It results in the target codec being reset to the default state. After the target codec completes its reset operation, an initialization sequence is requested.

7.3.3. Codec Initialization Sequence

- ❶ The codec drives SDI high at the last bit of SYNC to request a Codec Address (CAD) from the controller
- ❷ The codec stops driving the SDI during this turnaround period
- ❸❹❺❻ The controller drives SDI to assign a CAD to the codec
- ❼ The controller releases the SDI after the CAD has been assigned
- ❽ Normal operating state

Figure 13. Codec Initialization Sequence

7.4. Verb and Response Format

7.4.1. Command Verb Format

There are two types of verbs: one with 4-bit identifiers (4-bit verbs) and 16-bits of data, the other with 12-bit identifiers (12-bit verbs) and 8-bits of data. Table 11 shows the 4-bit verb structure of a command stream sent from the controller to operate the codec. Table 12 is the 12-bit verb structure that gets and controls parameters in the codec.

7.4.2. Response Format

There are two types of response from the codec to the controller. Solicited Responses are returned by the codec in response to a current command verb. The codec will send Solicited Response data in the next frame, without regard to the Set (Write) or Get (Read) command. The 32-bit response is interpreted by software, opaque to the controller.

Unsolicited Responses are sent by the codec independently of software requests. Jack Detection or GPI status information can be actively delivered to the controller and interpreted by software. The ‘Tag’ in Bit[31:28] is used to identify unsolicited events. This tag is undefined in the HDA specifications.

7.5. Power Management

The ALC662 does not support Wake-Up events when in low-power mode. All power management state changes in widgets are driven by software. Table 17 shows the System Power State Definitions. Table 18 indicates those nodes that support power management. To simplify power control, software can configure whole codec power states through the audio function (NID=01h). Output converters (DACs) and input converters (ADCs) have no individual power control to supply fine-grained power control.

7.5.1. System Power State Definitions

Table 17. System Power State Definitions

Power States	Definitions
D0	All power on. Individual DACs and ADCs can be powered up or down as required.
D1	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, analog reference stays up.
D2	All amplifiers and converters (DACs and ADCs) are powered down. State maintained, but analog reference is off (D1 + analog reference off).
D3 (Hot)	Power still supplied. The codec stops the internal clock. State is maintained.

8. Supported Verbs and Parameters

This section describes the Verbs and Parameters supported by various widgets in the ALC662. If a verb is not supported by the addressed widget, it will respond with 32 bits of '0'.

8.1. Verb – Get Parameters (Verb ID=F00h)

The 'Get Parameters' verb is used to get system information and the function capabilities of the HDA codec. All the parameters are read-only. There are a total of 15 ID parameters defined for each widget. Some parameters are supported only in a specific widget. Refer to section 7.4.1 Command Verb Format, page 20, to get detailed information about supported parameters.

Table 20. Verb – Get Parameters (Verb ID=F00h)

Get Parameter Command Format

Bit [31:28]	Bit [27:20]	Bit [19:8]	Payload Bit [7:0]
CAd=X	Node ID=00h	Verb ID=F00h	Parameter ID[7:0]

Codec Response Format

Response [31:0]
32-bit Response

Note: If the parameter ID is not supported, the returned response is 32 bits of '0'.

8.1.1. Parameter – Vendor ID (Verb ID=F00h, Parameter ID=00h)

Table 21. Parameter – Vendor ID (Verb ID=F00h, Parameter ID=00h)

Codec Response Format

Bit	Description
31:16	Vendor ID=10ECh (Realtek's PCI vendor ID).
15:0	Device ID=0662h.

Note: The Root Node (NID=00h) supports this parameter.

8.1.2. Parameter – Revision ID (Verb ID=F00h, Parameter ID=02h)

Table 22. Parameter – Revision ID (Verb ID=F00h, Parameter ID=02h)

Codec Response Format

Bit	Description
31:24	Reserved. Read as 0's.
23:20	MajRev=1h. The major version number (in decimal) of the HDA Specification.
19:16	MinRev=0h. The minor version number (in decimal) of the HDA Specification.
15:8	Revision ID. The vendor's revision number. <i>Note: 01h indicates ALC662 silicon.</i>
7:0	Stepping ID. The vendor's stepping number within the given Revision ID.

Note: The Root Node (NID=00h) supports this parameter.

8.1.3. Parameter – Subordinate Node Count (Verb ID=F00h, Parameter ID=04h)

For the root node, the Subordinate Node Count provides information about audio function group nodes associated with the root node.

For function group nodes, it provides the total number of widgets associated with this function node.

Table 23. Parameter – Subordinate Node Count (Verb ID=F00h, Parameter ID=04h)

Codec Response Format

Bit	Description
31:24	Reserved. Read as 0's.
23:16	Starting Node Number. The starting node number in the sequential widgets.
15:8	Reserved. Read as 0's.
7:0	Total Number of Nodes. For a root node, this is the total number of function groups in the root node. For a function group, this is the total number of widget nodes in the function group.

8.1.4. Parameter – Function Group Type (Verb ID=F00h, Parameter ID=05h)

Table 24. Parameter – Function Group Type (Verb ID=F00h, Parameter ID=05h)

Codec Response Format

Bit	Description
31:9	Reserved. Read as 0's.
8	UnSol Capable. 0: Unsolicited response is not supported by this function group 1: Unsolicited response is supported by this function group
7:0	Function Group Type. 00h: Reserved 01h: Audio Function 02h: Modem Function 03h~7Fh: Reserved 80h~FFh: Vendor Defined Function

8.1.5. Parameter – Audio Function Capabilities (Verb ID=F00h, Parameter ID=08h)

Table 25. Parameter – Audio Function Capabilities (Verb ID=F00h, Parameter ID=08h)

Codec Response Format

Bit	Description
31:17	Reserved. Read as 0's.
16	Beep Generator. A '1' indicates the presence of an integrated Beep generator within the Audio Function Group.
15:12	Reserved. Read as 0's.
11:8	Input Delay. Number of samples delay from analog input to HDA link.
7:4	Reserved. Read as 0's.
3:0	Output Delay. Number of samples delay from HDA link to analog output.

8.1.6. Parameter – Audio Widget Capabilities (Verb ID=F00h, Parameter ID=09h)

Table 26. Parameter – Audio Widget Capabilities (Verb ID=F00h, Parameter ID=09h)

Codec Response Format

Bit	Description
31:24	Reserved. Read as 0's.
23:20	Widget Type. 0h: Audio Output 1h: Audio Input 2h: Mixer 3h: Selector 4h: Pin Complex 5h: Power Widget 6h: Volume Knob Widget 7h~Eh: Reserved Fh: Vendor defined audio widget
19:16	Delay. Samples delayed between the HDA link and widgets.
15:12	Reserved. Read as 0's.
11:	L-R Swap. 0: Left channel and right channel swapping is not supported 1: Left channel and right channel swapping is supported
10	Power Control. 0: Power control is not supported on this widget 1: Power control is supported on this widget
9	Digital. 0: An analog input or output converter 1: A widget translating digital data between the HDA link and digital I/O (SPDIF, I2S, etc.)
8	ConnList. Connection List. 0: Connected to HDA link. No Connection List Entry will be queried 1: Connection List Entry must be queried
7	UnsolCap. Unsolicited Capable. 0: Unsolicited response is not supported 1: Unsolicited response is supported
6	ProcWidget. Processing Widget. 0: No processing control 1: Processing control is supported
5	Reserved. Read as 0.
4	Format Override. <i>Note: The ALC662 supports 16/20/24-bit with 44.1kHz, 48kHz, and 96kHz sample rate. The format (parameter ID=0Ah) must be queried</i>
3	AmpParOvr (AMP Param Override). Override amplifier parameters (Gain Control) in individual output Pin Complexes, ADCs, and Mixer widgets.
2	OutAmpPre (Out AMP Present). There are amplifiers (Mute Control) in individual output Pin Complexes.
1	InAmpPre (In AMP Present). There are amplifiers (Gain Control) in individual ADCs and Mixer widgets.
0	Stereo. 0: Mono Widget 1: Stereo Widget

8.1.7. Parameter – Supported PCM Size, Rates (Verb ID=F00h, Parameter ID=0Ah)

Parameters in audio functions provide default information about formats. Individual converters have their own parameters to provide supported formats if their ‘Format Override’ bit is set.

Table 27. Parameter – Supported PCM Size, Rates (Verb ID=F00h, Parameter ID=0Ah)

Codec Response Format

Bit	Description
31:21	Reserved. Read as 0's.
20	B32. 32-bit audio format support. 0: Not supported 1: Supported
19	B24. 24-bit audio format support. 0: Not supported 1: Supported (The ALC662 DAC supports this format)
18	B20. 20-bit audio format support. 0: Not supported 1: Supported (The ALC662 DAC supports this format)
17	B16. 16-bit audio format support. 0: Not supported 1: Supported (The ALC662 DAC supports this format)
16	B8. 8-bit audio format support. 0: Not supported 1: Supported
15:12	Reserved. Read as 0's.
11	R12. 384kHz (=8*48kHz) rate support. 0: Not supported 1: Supported
10	R11. 192kHz (=4*48kHz) rate support. 0: Not supported 1: Supported
9	R10. 176.4Hz (=4*44.1kHz) rate support. 0: Not supported 1: Supported
8	R9. 96kHz (=2*48kHz) rate support. 0: Not supported 1: Supported (The ALC662 DAC and ADC support this sample rate)
7	R8. 88.2kHz (=2*44.1kHz) rate support. 0: Not supported 1: Supported
6	R7. 48kHz rate support. 0: Not supported 1: Supported (The ALC662 DAC and ADC support this sample rate)
5	R6. 44.1kHz rate support. 0: Not supported 1: Supported (The ALC662 DAC and ADC support this sample rate)
4	R5. 32kHz (=2/3*48kHz) rate support. 0: Not supported 1: Supported
3	R4. 22.05kHz (=1/2*44.1kHz) rate support. 0: Not supported 1: Supported
2	R3. 16kHz (=1/3*48kHz) rate support. 0: Not supported 1: Supported
1	R2. 11.025kHz (=1/4*44.1kHz) rate support. 0: Not supported 1: Supported
0	R1. 8kHz (=1/6*48kHz) rate support. 0: Not supported 1: Supported

8.1.8. Parameter – Supported Stream Formats (Verb ID=F00h, Parameter ID=0Bh)

Parameters in this node only provide default information for audio function groups. Individual converters have their own parameters to provide supported formats if the ‘Format Override’ bit is set.

Table 28. Parameter – Supported Stream Formats (Verb ID=F00h, Parameter ID=0Bh)

Codec Response Format

Bit	Description
31:3	Reserved. Read as 0's.
2	AC3. 0: Not supported 1: Supported
1	Float32. 0: Not supported 1: Supported
0	PCM. 0: Not supported 1: Supported (The ALC662 DAC and ADC support this format)

Note: Input converters and output converters support this parameter.

8.1.9. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

The Pin Capabilities parameter returns a bit field describing the capabilities of the Pin Complex widget.

Table 29. Parameter – Pin Capabilities (Verb ID=F00h, Parameter ID=0Ch)

Codec Response Format

Bit	Description														
31:16	Reserved. Read as 0's.														
15:8	VREF Control Capability. ‘1’ in corresponding bit field indicates signal levels of associated Vrefout are specified as a percentage of AVDD. <table><tr><td>7:6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>Reserved</td><td>100%</td><td>80%</td><td>Reserved</td><td>Ground</td><td>50%</td><td>Hi-Z</td></tr></table>	7:6	5	4	3	2	1	0	Reserved	100%	80%	Reserved	Ground	50%	Hi-Z
7:6	5	4	3	2	1	0									
Reserved	100%	80%	Reserved	Ground	50%	Hi-Z									
7	Reserved.														
6	Balanced I/O Pin. ‘1’ indicates this pin complex has balanced pins.														
5	Input Capable. ‘1’ indicates this pin complex supports input.														
4	Output Capable. ‘1’ indicates this pin complex supports output.														
3	Headphone Drive Capable. ‘1’ indicates this pin complex has an amplifier to drive a headphone.														
2	Presence Detect Capable. ‘1’ indicates this pin complex can detect whether there is a device plugged in.														
1	Trigger Required. ‘1’ indicates whether a software trigger is required for an impedance measurement.														
0	Impedance Sense Capable. ‘1’ indicates this pin complex can perform analog sensing on the attached device to determine its type.														

Note: Only Pin Complex widgets support this parameter.

8.1.10. Parameter – Amplifier Capabilities (Verb ID=F00h, Input Amplifier Parameter ID=0Dh)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the ‘AMP Param Override’ bit is set.

Table 30. Parameter – Amplifier Capabilities (Verb ID=F00h, Input Amplifier Parameter ID=0Dh)

Codec Response Format

Bit	Description
31	(Input) Mute Capable.
30:23	Reserved. Read as 0.
22:16	Step Size. Indicates the size of each step in the gain range.
15	Reserved. Read as 0.
14:8	Number of Steps. Indicates the number of steps in the gain range. ‘0’ means the gain is fixed.
7	Reserved. Read as 0.
6:0	Offset. Indicates which step is 0dB.

8.1.11. Parameter – Amplifier Capabilities (Verb ID=F00h, Output Amplifier Parameter ID=12h)

Parameters in this node provide audio function group default information. Individual converters have their own parameters to provide amplifier capabilities if the ‘AMP Param Override’ bit is set.

Table 31. Parameter – Amplifier Capabilities (Verb ID=F00h, Output Amplifier Parameter ID=12h)

Codec Response Format

Bit	Description
31	(Output) Mute Capable.
30:23	Reserved. Read as 0.
22:16	Step Size. Indicates the size of each step in the gain range. Each individual step may be 0~32dB, specified in 0.25dB steps. ‘0’ indicates 0.25dB steps. ‘127’ indicates 32dB steps.
15	Reserved. Read as 0.
14:8	Number of Steps. Indicates the number of steps in the gain range. ‘0’ means the gain is fixed.
7	Reserved. Read as 0.
6:0	Offset. Indicates which step is 0dB.

8.1.12. Parameter – Connect List Length (Verb ID=F00h, Parameter ID=0Eh)

Parameters in this node provide audio function widget connection information.

Table 32. Parameter – Connect List Length (Verb ID=F00h, Parameter ID=0Eh)

Codec Response Format

Bit	Description
31:8	Reserved. Read as 0.
7	Short Form. 0: Short Form 1: Long Form
6:0	Connect List Length. Indicates the number of inputs connected to a widget. If the Connect List Length is 1, there is only one input, and there is no Connection Select Control (not a MUX widget).

8.1.13. Parameter – Supported Power States (Verb ID=F00h, Parameter ID=0Fh)

Table 33. Parameter – Supported Power States (Verb ID=F00h, Parameter ID=0Fh)

8.1.15. Parameter – GPIO Capabilities (Verb ID=F00h, Parameter ID=11h)

Table 35. Parameter – GPIO Capabilities (Verb ID=F00h, Parameter ID=11h)

Codec Response Format

Bit	Description
31	GPIWake=0. The ALC662 does not support GPIO wake-up function.
30	GPIUnsol=1. The ALC662 supports GPIO unsolicited response.
29:24	Reserved. Read as 0's.
23:16	NumGPIs=00h. No GPI pin is supported.
15:8	NumGPOs=00h. No GPO pin is supported.
7:0	NumGPIOs=02h. Two GPIO pins are supported.

8.1.16. Parameter – Volume Knob Capabilities (Verb ID=F00h, Parameter ID=13h)

Table 36. Parameter – Volume Knob Capabilities (Verb ID=F00h, Parameter ID=13h)

Codec Response Format for NID=21h (Volume Control Knob)

Bit	Description
31:8	Reserved. Read as 0's.
7	Delta. 0: Software cannot modify the Volume Control Knob volume 1: Software can write a base volume to the Volume Control Knob
6:0	NumSteps. The number of steps in the range of the Volume Control Knob

Note: The ALC662 does not support volume knob and will respond with 0s to this parameter.

15	Set Output Amp. 1: Indicates output amplifier gain will be set
14	Set Input Amp. 1: Indicates input amplifier gain will be set
13	Set Left Amp. 1: Indicates left amplifier gain will be set
12	Set Right Amp. 1: Indicates right amplifier gain will be set
11:8	Index Offset (for input amplifiers on Sum widgets and Selector Widgets). 5-bit index offset in connection list is used to select the input gain that will be set on a Sum or a Selector widget. The index is ignored if the node is not a Sum or a Selector widget, or the ‘Set Input Amp’ bit is not set.
7	Mute. 0: Unmute 1: Mute ($-\infty$ gain)
6:0	Gain[6:0]. A 7-bit step value specifying the amplifier gain.

‘Divider’ in Set Command

Bit	Description
31:8	Reserved.
7:0	Frequency Divider, F[7:0]. The internal BEEP frequency is the result of dividing the 48kHz clock by 4 times the number specified in F[7:0]. The lowest tone is 48kHz/(255*4)=47Hz. The highest tone is 48kHz/(1*4)=12kHz. A value of 00h in F[7:0] disables the internal BEEP generator and allows external PCBEEP input.

Note: All nodes except BEEP generator (NID=01h) will ignore this verb.

10. Application Circuits

The ALC662 series is fully pin to pin compatible with the ALC88x series. Please contact Realtek to get the latest application circuits. To get the best compatibility in hardware design and software driver, any modifications should be confirmed by Realtek. Realtek may update the latest application circuits onto our website (www.realtek.com) without modifying this data sheet.
